

On the 13th of May, there is an industry talk by iZeno, Singapore. It was a meaningful sharing session that provided valuable exposure to real industry practices especially in the areas of data engineering, production pipelines and implementing artificial intelligence. This was my first time hearing about iZeno and know about them. Through this session, a clearer understanding of the company background, services and working culture was gained. The sharing was delivered by Arissa Wong and Jovinka Hartanto, who provided both company insights and practical technical knowledge from their industry experience.

At the beginning of the session, Arissa introduced iZeno and explained the company's role in delivering digital and technology solutions for their clients. From the sharing, it was understood that iZeno works with different technologies and helps organizations build systems, automate processes and improve business operations through data and AI-related solutions. This has shown how technology consulting companies support clients by solving real business problems rather than only focusing on technical implementation.

Jovinka then shared her personal journey, working experience and technical insights from real production pipeline projects. One of the most interesting parts of the session was the explanation of how a real production pipeline is built. The pipeline included several important stages such as source systems, ingestion layer, Bronze layer, Silver layer, Gold layer, AI or LLM layer, BI and analytics and monitoring or alerts. This helped me understand that an actual industry pipeline is more complex compared to what is usually shown in academic projects. In industry, more attention is given to data quality, reliability, monitoring, scalability and business impact.

The session also included case studies such as an AI-powered news intelligence platform. Through this example, it was learned that AI can be used to automate news ingestion, summarization, classification and entity extraction. This reduced manual processing time and allowed analysts to focus more on insights rather than repetitive data entry tasks.

Overall, the iZeno industry talk was eye-opening because it connected classroom knowledge with real-world applications. It helped me realize the importance of building strong foundations in data pipelines, cloud platforms, AI tools and problem-solving skills. The session also gave a

better idea of the current industry expectations and to be well-prepared with more practical and industry-relevant skills.
